

IT Support Policy

Laptop, account, VPN, software, network, email, tickets, priority, and escalation

Knowledge-base note: This document is fictional sample company policy content created for the WorkMate AI RAG demonstration. Employees should follow the actual company's approved procedures where they differ.

1. Purpose and Scope

This policy explains how employees should report technology problems and what information helps IT resolve issues efficiently.

2. Creating an IT Ticket

Employees should provide employee ID, affected device or service, issue description, error message if available, and when the issue began.

WorkMate may create a ticket and return a unique ID such as IT-001. Employees should keep the ID for future status checks.

3. Ticket Lifecycle

Typical statuses include Open, In Progress, Pending, and Closed.

Open means the ticket has been created and requires work. In Progress means IT is actively investigating or resolving it. Pending means IT is waiting for information, access, a part, or another dependency. Closed means the support workflow has been completed.

4. Laptop Running Slowly

Employees can restart the device, close unnecessary applications, and check whether the issue occurs repeatedly.

If the problem continues, an IT ticket should describe when the slowdown occurs and which applications are affected.

Employees should not install unknown performance tools or modify security settings without IT guidance.

5. Laptop Not Starting

If a company laptop does not start, employees should report the device and visible symptoms. They should not open the device or attempt hardware repair unless authorized.

If the issue affects business-critical work, the employee should mention the urgency in the ticket.

6. VPN Problems

For VPN problems, employees should provide the device, network being used, error message, and approximate time of failure.

Employees should use the approved VPN software and should not bypass company security controls with unauthorized remote-access tools.

7. Password and Account Access

Employees should use the approved password-reset or account-recovery process.

Passwords, one-time codes, and MFA approval requests must not be shared with another person.

Unexpected MFA prompts or suspicious account activity should be reported immediately.

8. Software Requests

Employees should request approved software through the designated IT process.

Software requiring administrative privileges should not be installed without authorization.

9. Internet and Network Problems

Employees should identify whether the problem affects one device, one location, or multiple employees.

Useful details include connection type, approximate time, affected service, and any error message.

10. Email Problems

Employees should report inability to send or receive business email, repeated login prompts, unusual messages, or suspicious attachments.

Suspicious emails should also be reported through the security process.

11. Printer and Office Devices

Printer problems should include the printer location, error message, and whether other employees are affected.

Other office technology problems should be reported with the device location and symptoms.

12. Ticket Priority

Critical business outages, security incidents, or problems affecting many employees may require urgent human escalation.

An individual non-critical issue can normally be handled through the standard ticket process.

13. Checking Ticket Status

Employees can ask WorkMate for the status of a known IT request ID or ask for their open requests.

If a ticket has been closed but the problem remains, the employee should contact IT and provide the original request ID when possible.

14. Common Employee Questions

My laptop is slow. Should I create a ticket?

If basic restart/troubleshooting does not resolve the issue, creating an IT ticket is appropriate.

How do I check my IT ticket?

Provide the request ID or ask WorkMate to show your open requests.

My VPN is not working while WFH. What should I do?

Report the device, network, error message, and time of failure and use the approved IT support process.

Can I install software myself?

Only approved software should be installed according to company procedures.
